AF ablation: success and failure

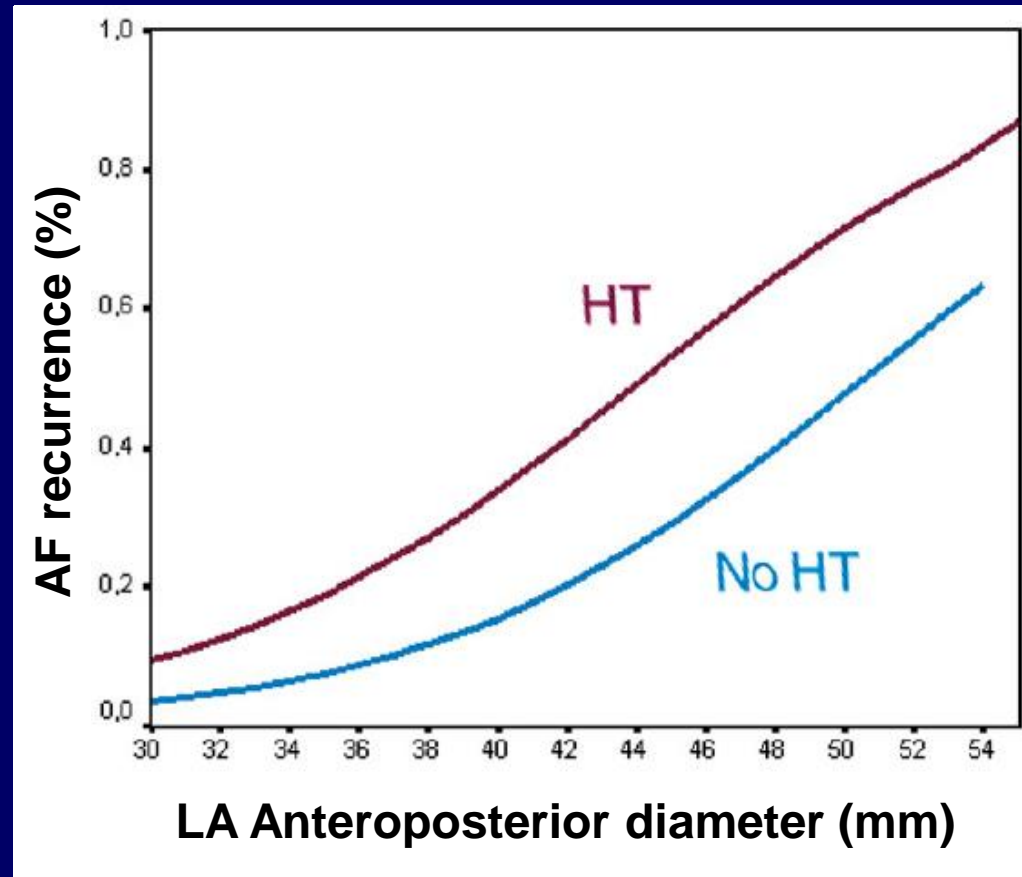

Assessment of substrates for AF

Prediction of successful RFCA

Independent predictors of AF recurrences after RFCA:

- Age
- Hypertension
- Permanent AF
- LA dimensions
- LV dimensions

1. Assessment of substrate for AF → Prediction of successful

RFCA

- LA enlargement
- LA fibrosis:
 - Mechanical consequences
 - Electrical conduction heterogeneities

2. Evaluation of successful RFCA on LA and LV performance

Left atrial dimensions

Linear dimensions
AP diameter

LA volume
Modified Simpson's rule

Real-time 3D echocardiography

Real-time 3D echocardiography

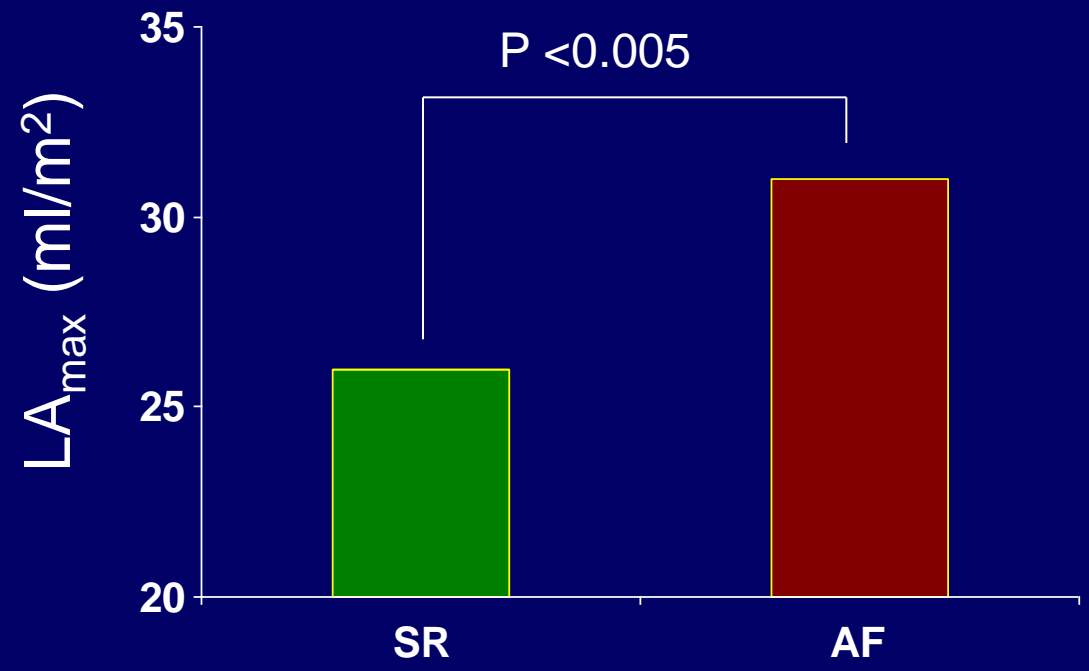

LA volumes:

- LA_{max}
 - just before mitral valve opening
- LA_{min}
 - just before mitral valve closure
- LA_{preA}
 - last frame before mitral valve reopening

Baseline RT3DE LA volumes

Left atrial tissue characterization

Calibrated integrated
backscatter

Tissue ultrasound reflectivity
measurement

LA fibrosis

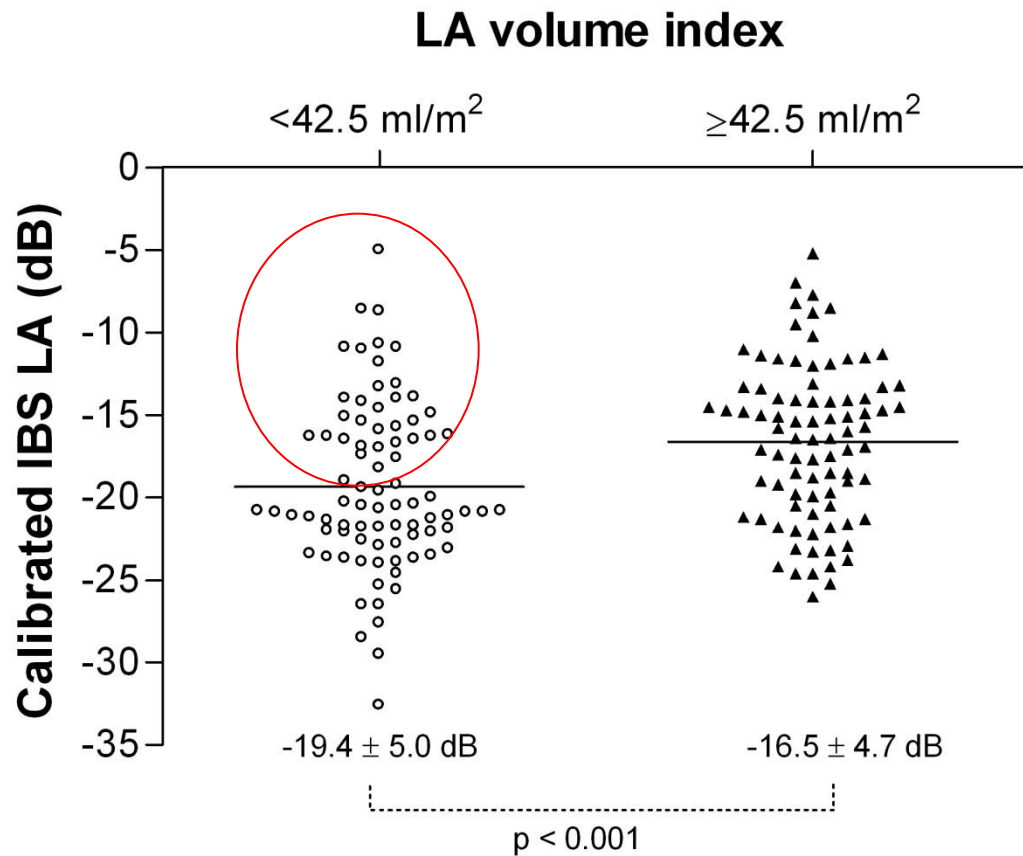

N = 170

77% male

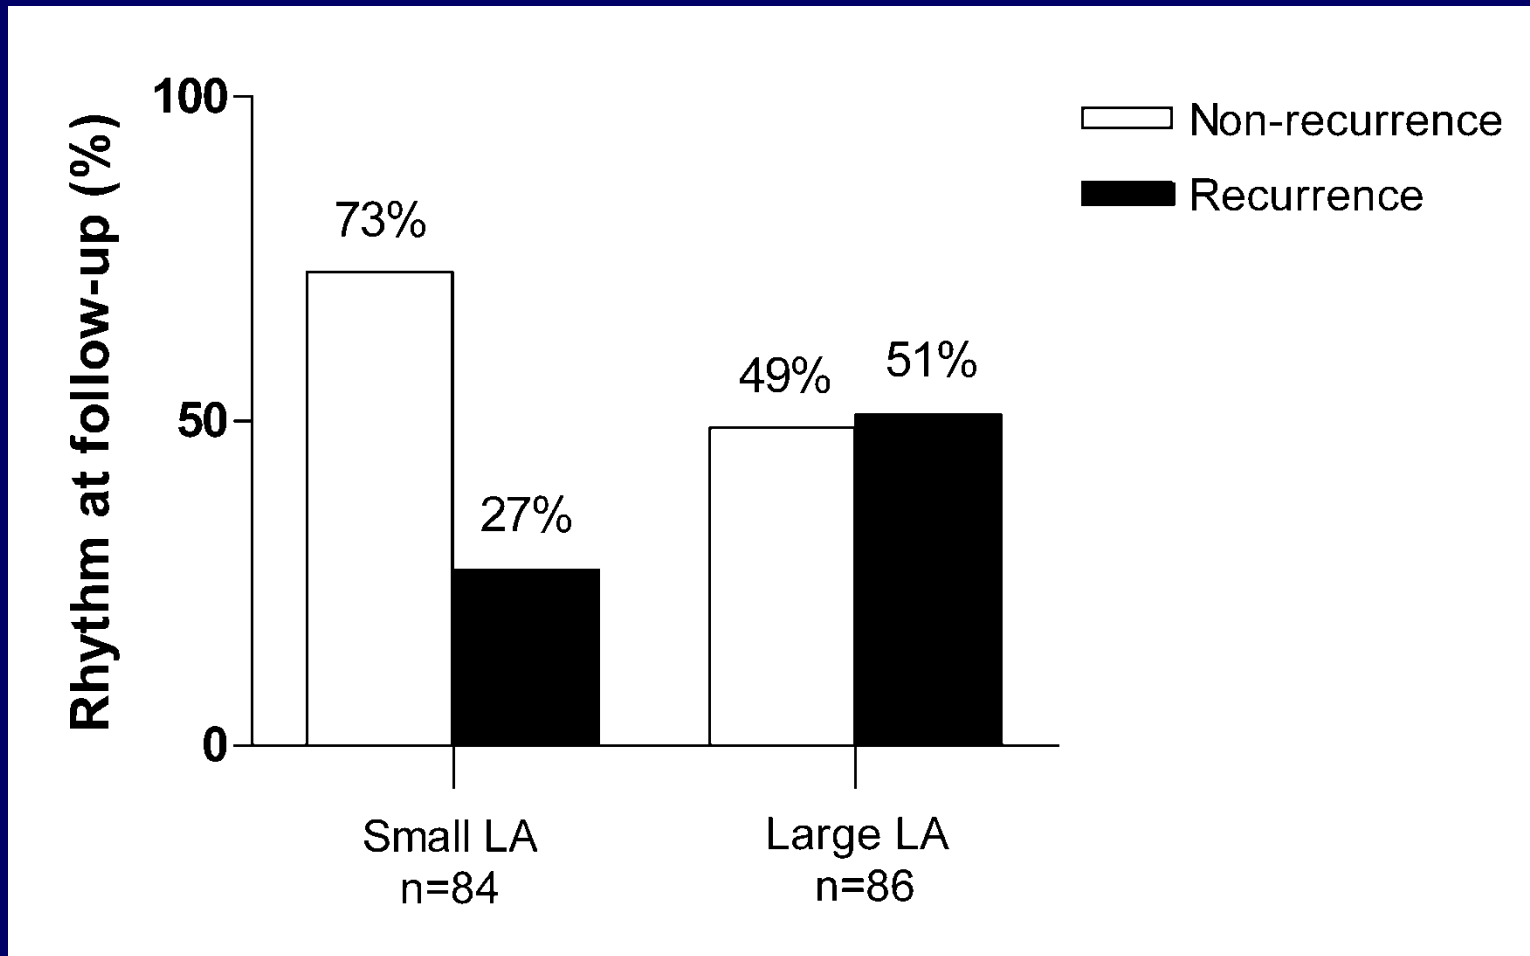

71% Paroxysmal AF

RFCA

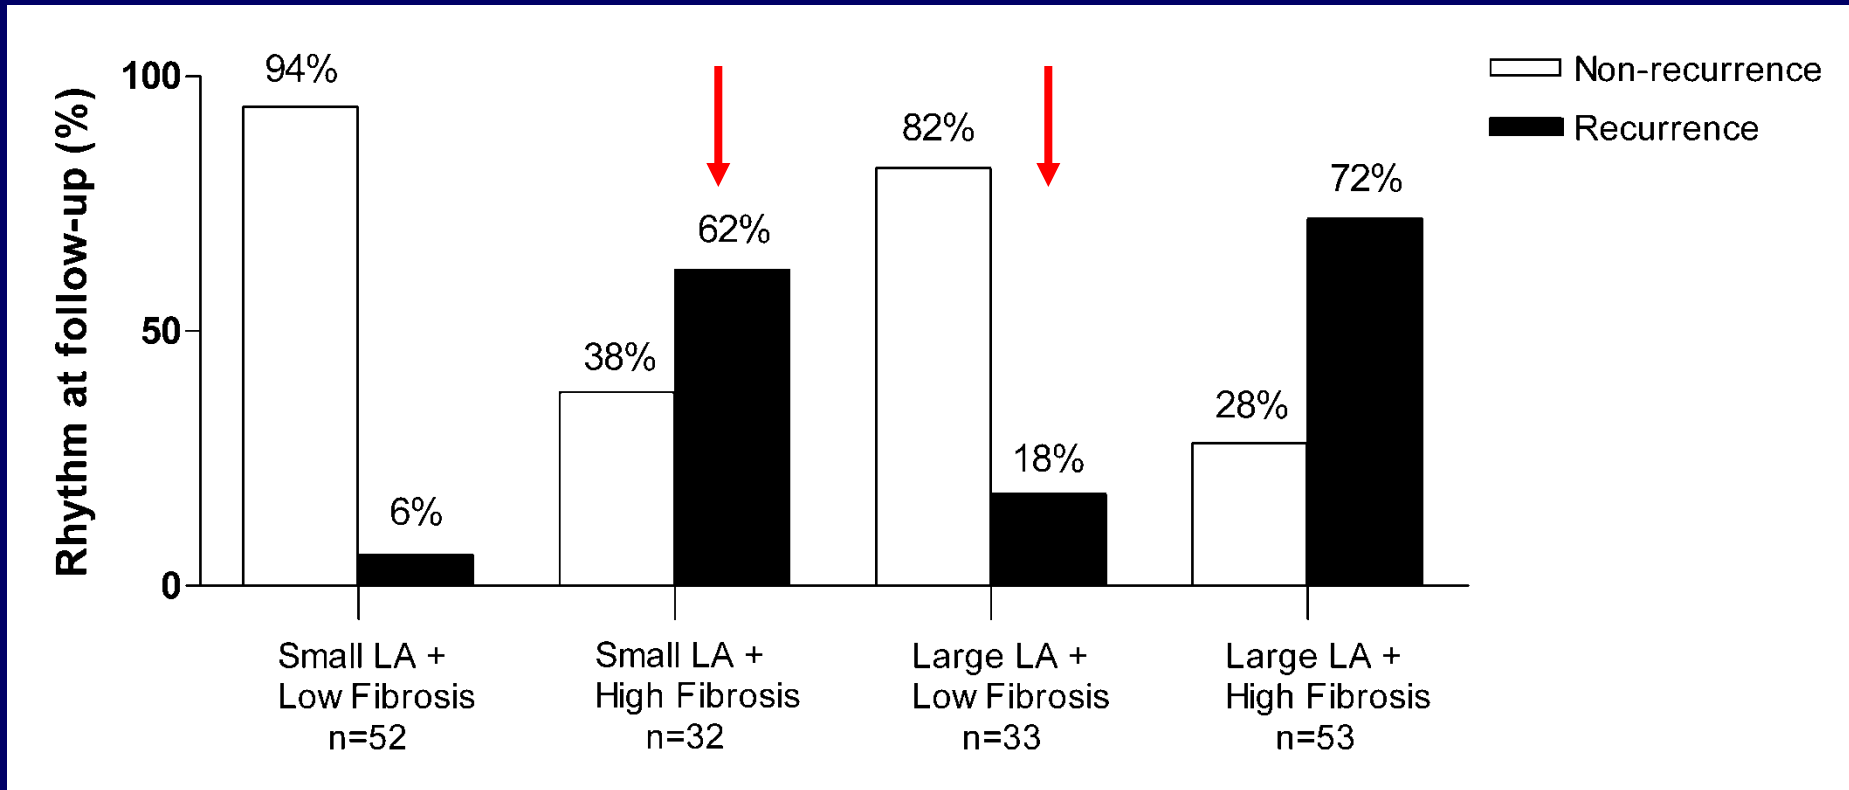

**“Small LA” can
show high fibrosis
content**

Outcome according to indexed LA volume

- Patients with “large LA” had more recurrences than patients with “small LA”.
- 27% of patients with “small LA” have also AF recurrences...why?

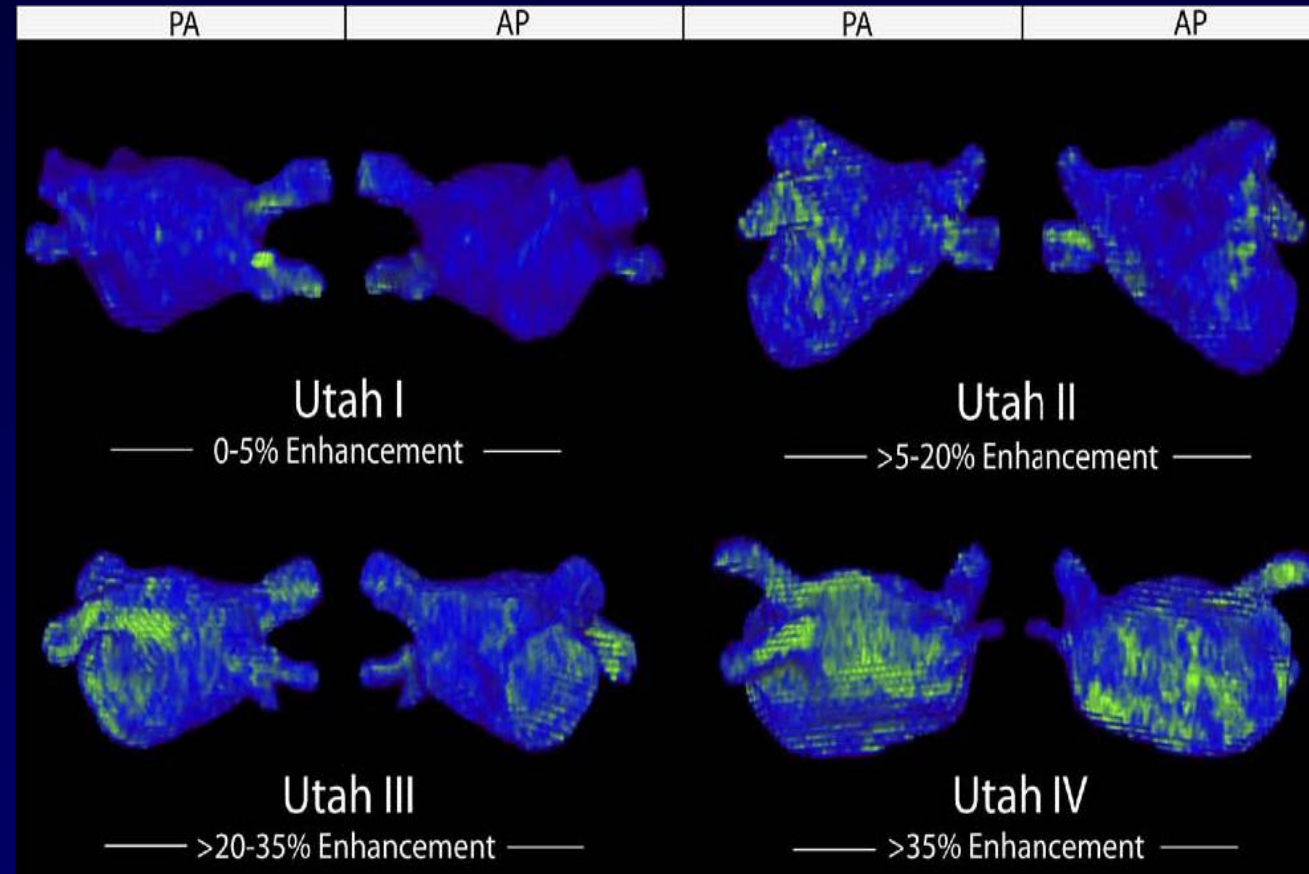

LA fibrosis content evaluation provides additional information in stratification of AF patients undergoing RFCA

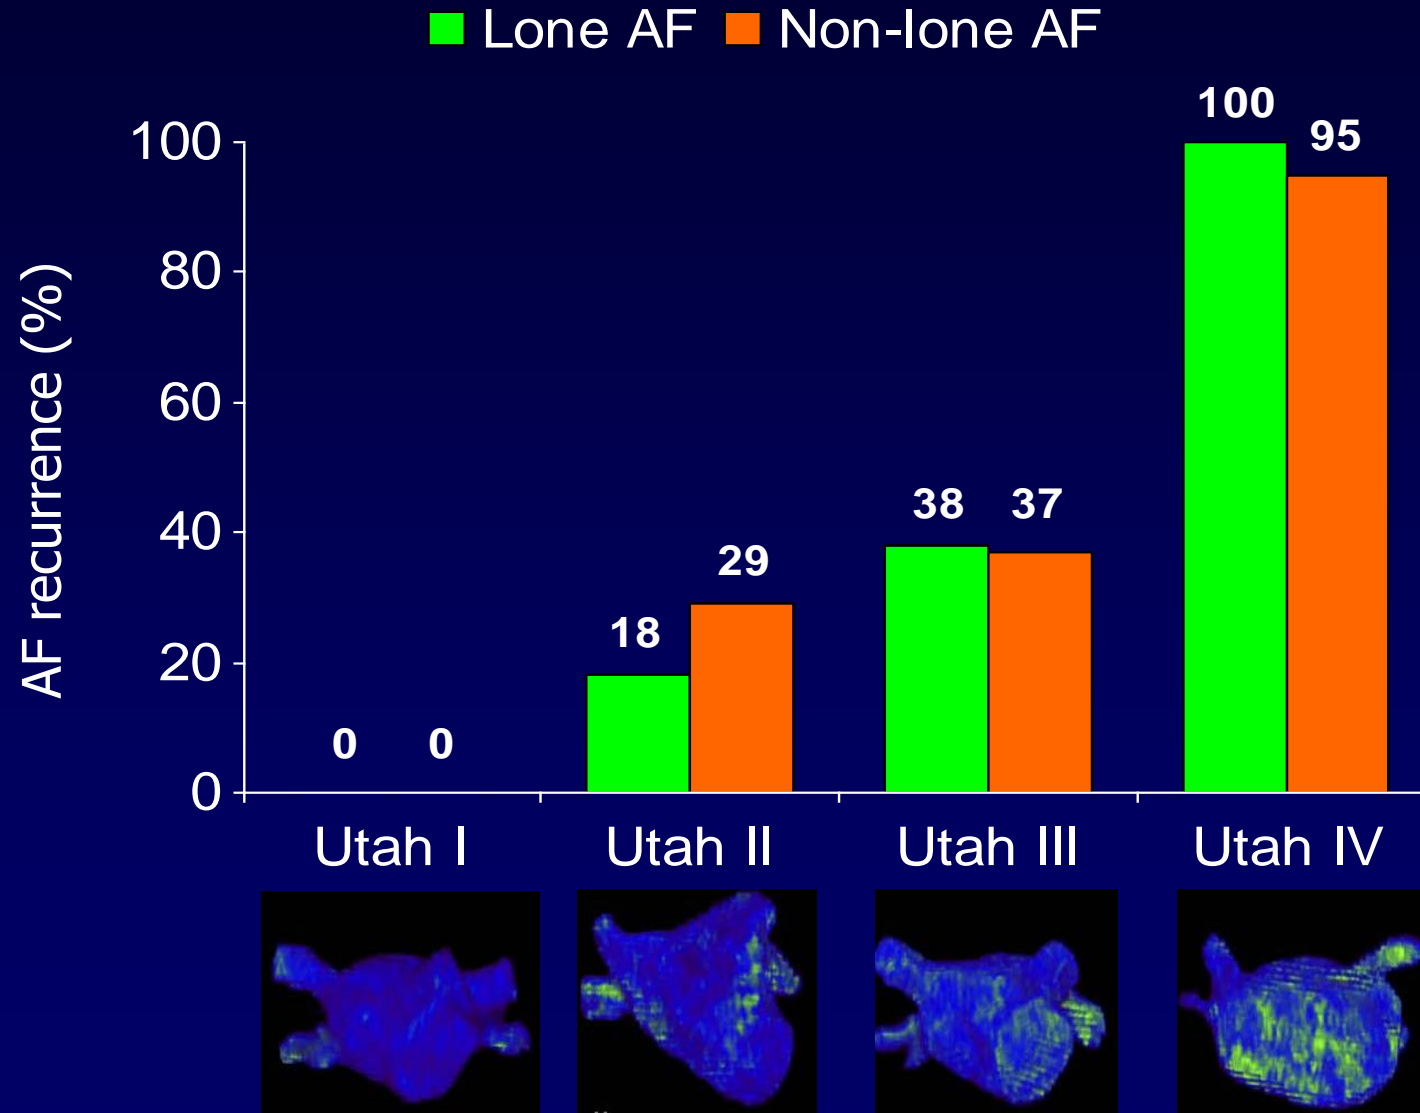

Left atrial tissue characterization - MRI

- **N = 333 AF patients**
- **LA fibrosis before RFCA: DE-MRI**

LA fibrosis vs. RFCA outcome

Left atrial mechanical properties

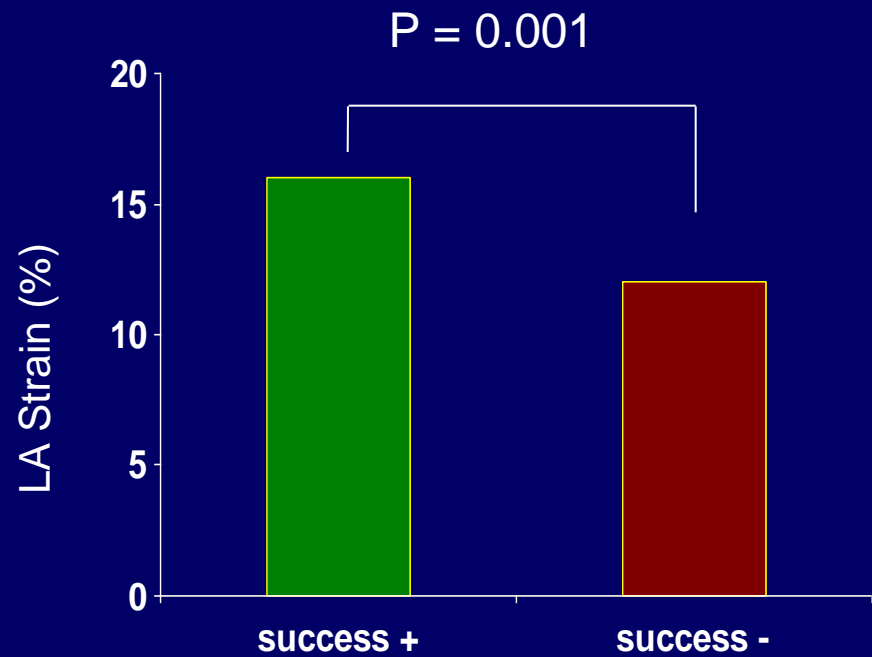

Strain imaging

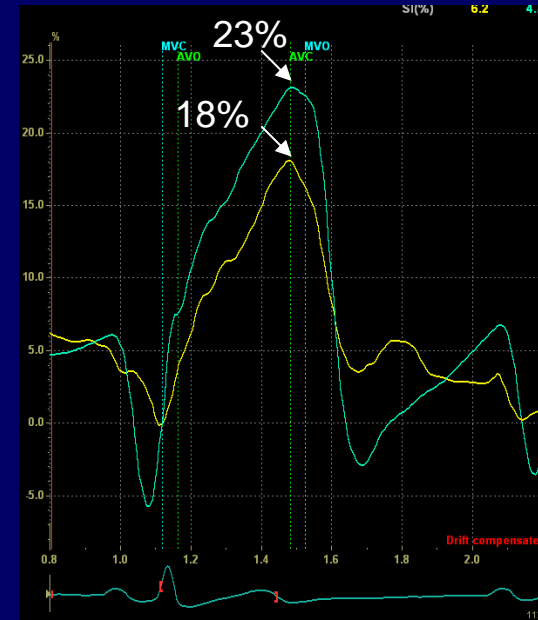

**Active deformation
of the LA**

LA strain at baseline

Remodeler
 $\downarrow LA_{max} \geq 15\%$

Non-remodeler
 $\downarrow LA_{max} < 15\%$

Left atrial electro-mechanical properties

TDI

**Total atrial conduction
time (PA-TDI)**

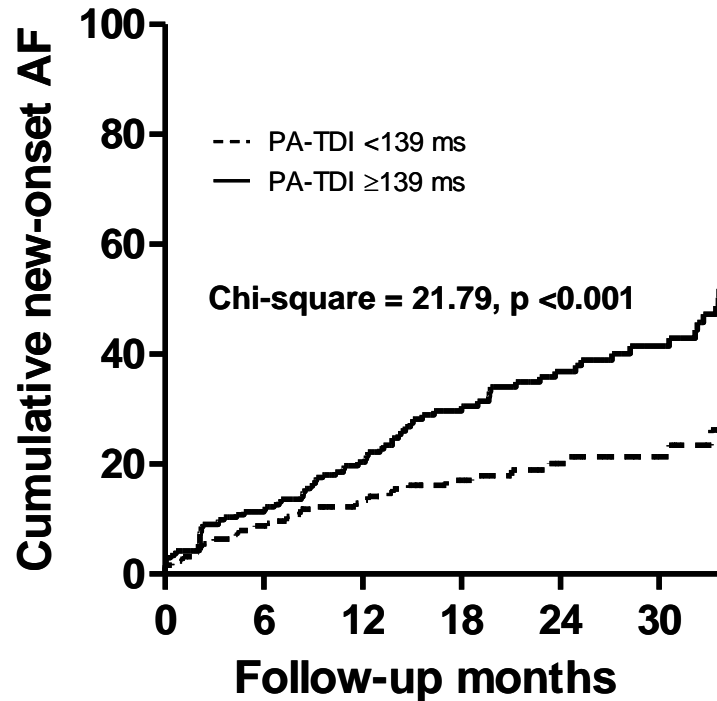

**Time interval from the
onset of the P-wave to
the A'-wave peak**

- PA-TDI as predictor of new onset AF in heart failure patients

N = 495

79% male

21% previous paroxysmal AF

Number of patients at risk:

PA-TDI duration <139 ms	253	226	140	94	66	38
PA-TDI duration ≥139 ms	242	193	133	83	64	43

PA-TDI

HR: 1.01 (1.01-1.02)

P<0.001

Patient 1

No AF

Patient 2

New onset AF

1. Assessment of substrate for AF → Prediction of successful

RFCA

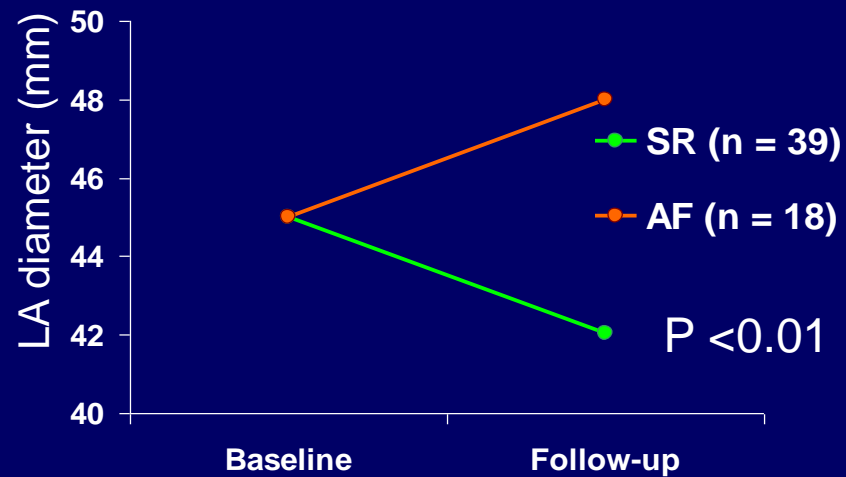

- LA enlargement
- LA fibrosis:
 - Mechanical consequences
 - Electrical conduction heterogeneities

2. Evaluation of successful RFCA on LA and LV performance

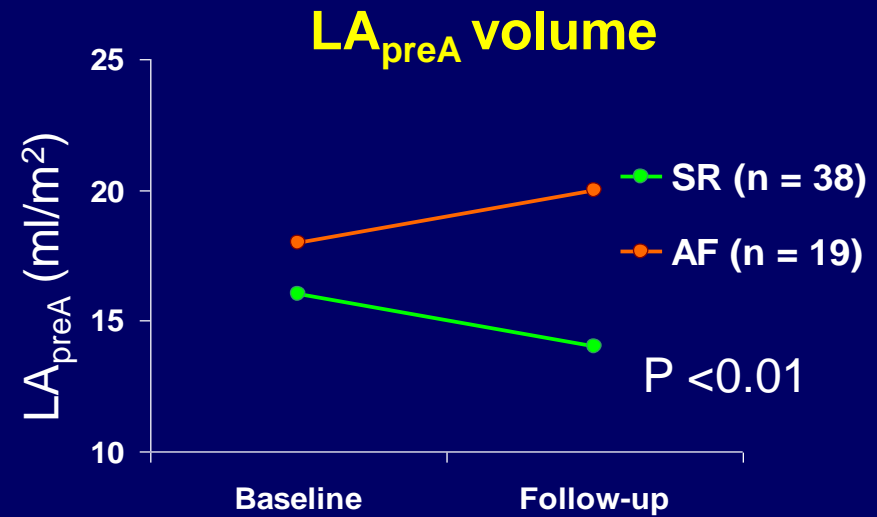

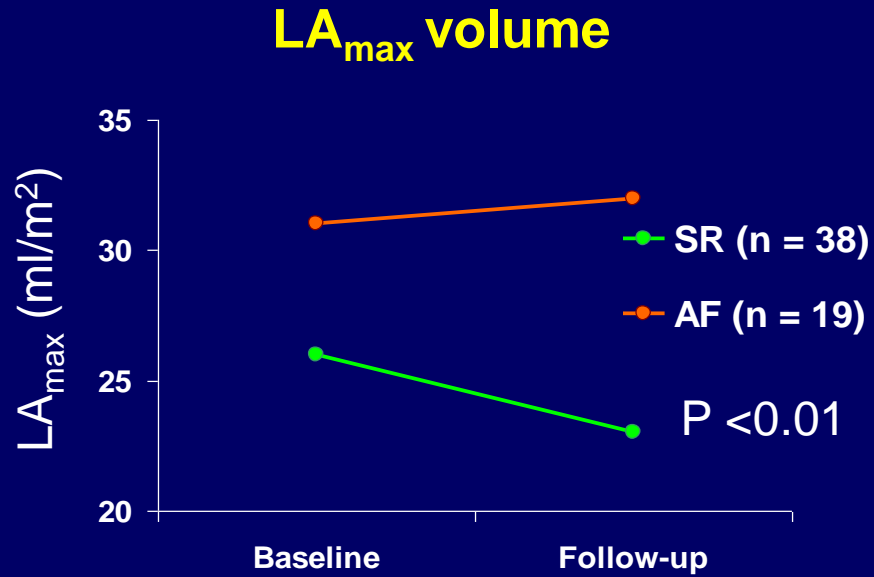

LA linear dimensions

LA volumes

Real-time 3D Echocardiography

Baseline

LA maximum volume: 51 ml

LA minimum volume: 35 ml

3 months after RFCA

LA maximum volume: 42 ml

LA minimum volume: 25 ml

LV mechanics

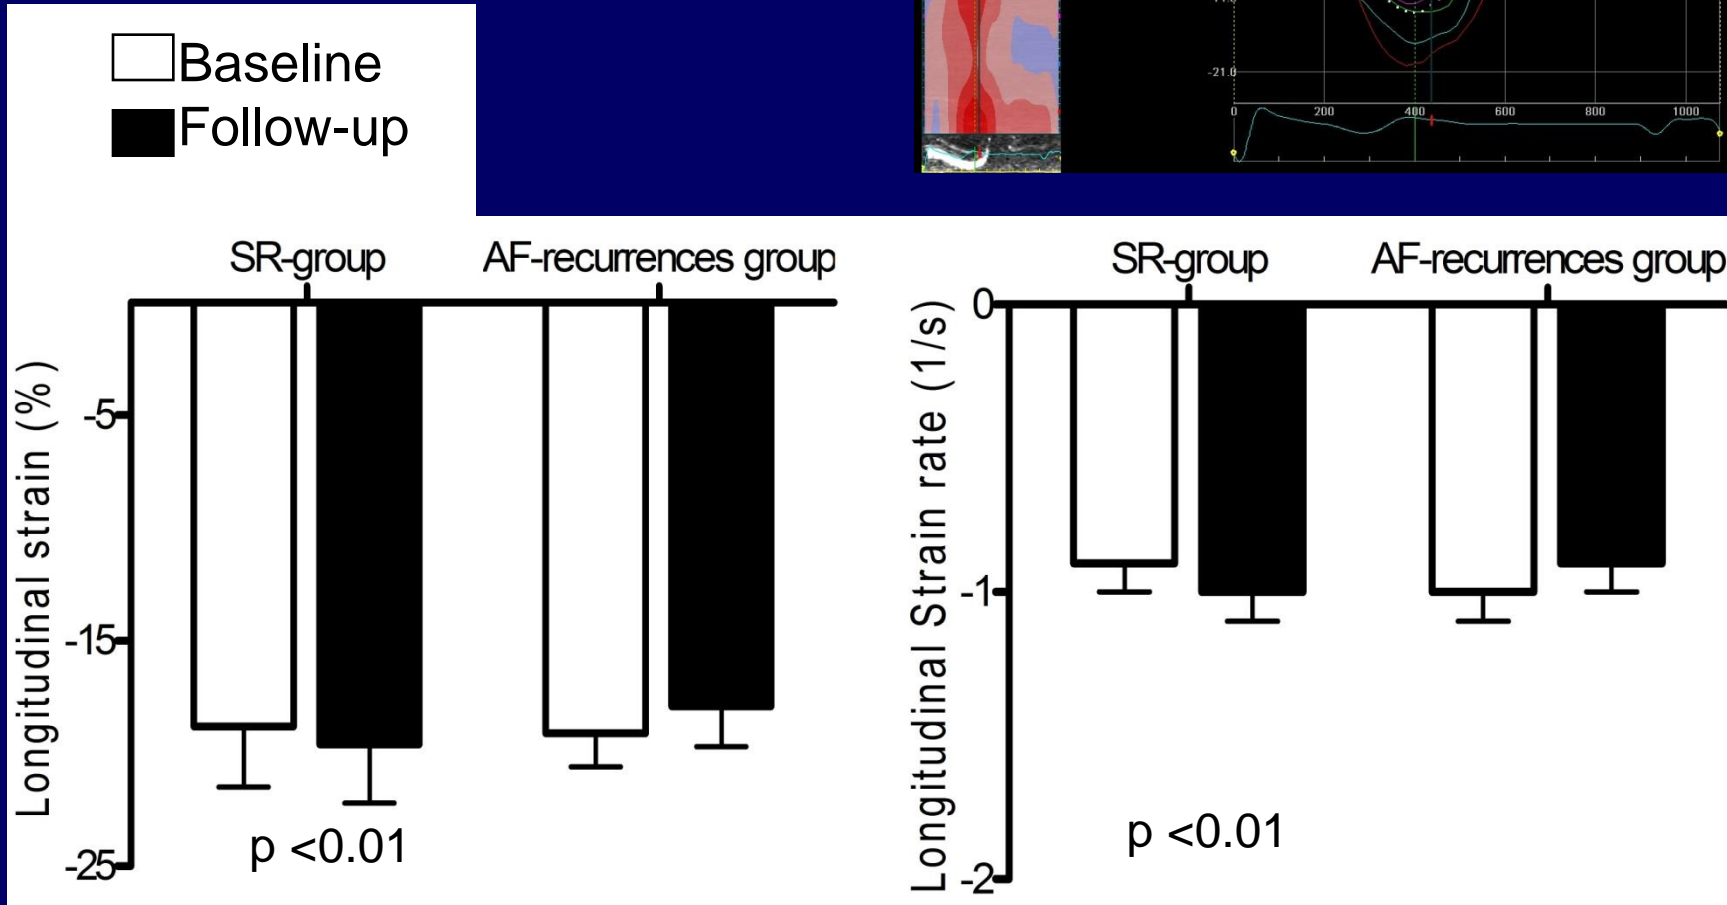

Longitudinal strain

Changes in Longitudinal strain/Sr according to the response to RFCA

Baseline

Follow-up

Comparable LV performance?

Baseline

Follow-up

Imaging in AF

1. LA size, function and fibrosis important for predicting successful RFCA
2. Evaluation of LA and LV performance after RFCA

We need anatomic and functional imaging
